

# Lawn Care: Overseeding

Lawns suffering from thin, bare patches or those without any grass at all require aggressive renovation techniques. The lawn may be revived by overseeding with a Lawn Seeder.

The hopper drops a measured amount of seed and the Lawn Seeder plants the seed by blending them into the soil through the action of the rotating knife blades. As the Lawn Seeder moves forward, the neoprene flap smooths the soil to cover the seed and aid germination.

For best results, it is recommended to overseed in two applications by cross cutting the first application at a 45° angle. Water thoroughly immediately after overseeding and lightly daily. Once the seed has germinated and grass has sprouted water regularly to encourage deeper root growth.
